Recall #: 24AV | FUEL PUMP Recall Date: 2014 Jul 22

Recall Description

It is possible that gas bubbles may form in the fuel system when winterized fuel with high vapor pressures is used in warmer areas or months with higher ambient temperatures or during engine hot soak. Engine hot soak occurs when a vehicle is at operating temperature and then is shut off. The condition occurs when the engine is restarted within a short period of time, before the engine has fully cooled down. When the vehicles, affected by this recall, have been operated under low load for an extended period of time, deposits may collect and degrade the electrical current flow inside the in-tank fuel pump leading to reduced fuel pump performance and pressure. If these conditions occur in combination, the fuel pump may not be able to overcome the vapor pressure under low loads and can potentially result in a vehicle stall directly after engine start, increasing the risk of a crash.

Remedy

Install improved Engine Control Module (ECM) software.
